

# Cardiomyopathies and Genetics

Heart Failure, Swiss Webinar series der Arbeitsgruppe Herzinsuffizienz

Christiane Gruner, Cardiology, University Heart Center, Zurich

# Content

1. Case No 1 – not everything that looks like dilative cardiomyopathy is a DCM
2. Case No 2 – value of EKG in the diagnostic process of cardiomyopathies
3. Case No 3 – HCM family and phenotypic expression

# Classification cardiomyopathies

## Primary cardiomyopathies

Dilatative cardiomyopathy

Hypertrophic cardiomyopathy

Arrhythmogenic right ventricular cardiomyopathy

Restrictive cardiomyopathy

others: left ventricular noncompaction cardiomyopathy,  
arrhythmogenic cardiomyopathies

## Secondary cardiomyopathies

Ischemic cardiomyopathy

Valvular cardiomyopathy

Hypertensive cardiomyopathy

Tachy-cardiomyopathies

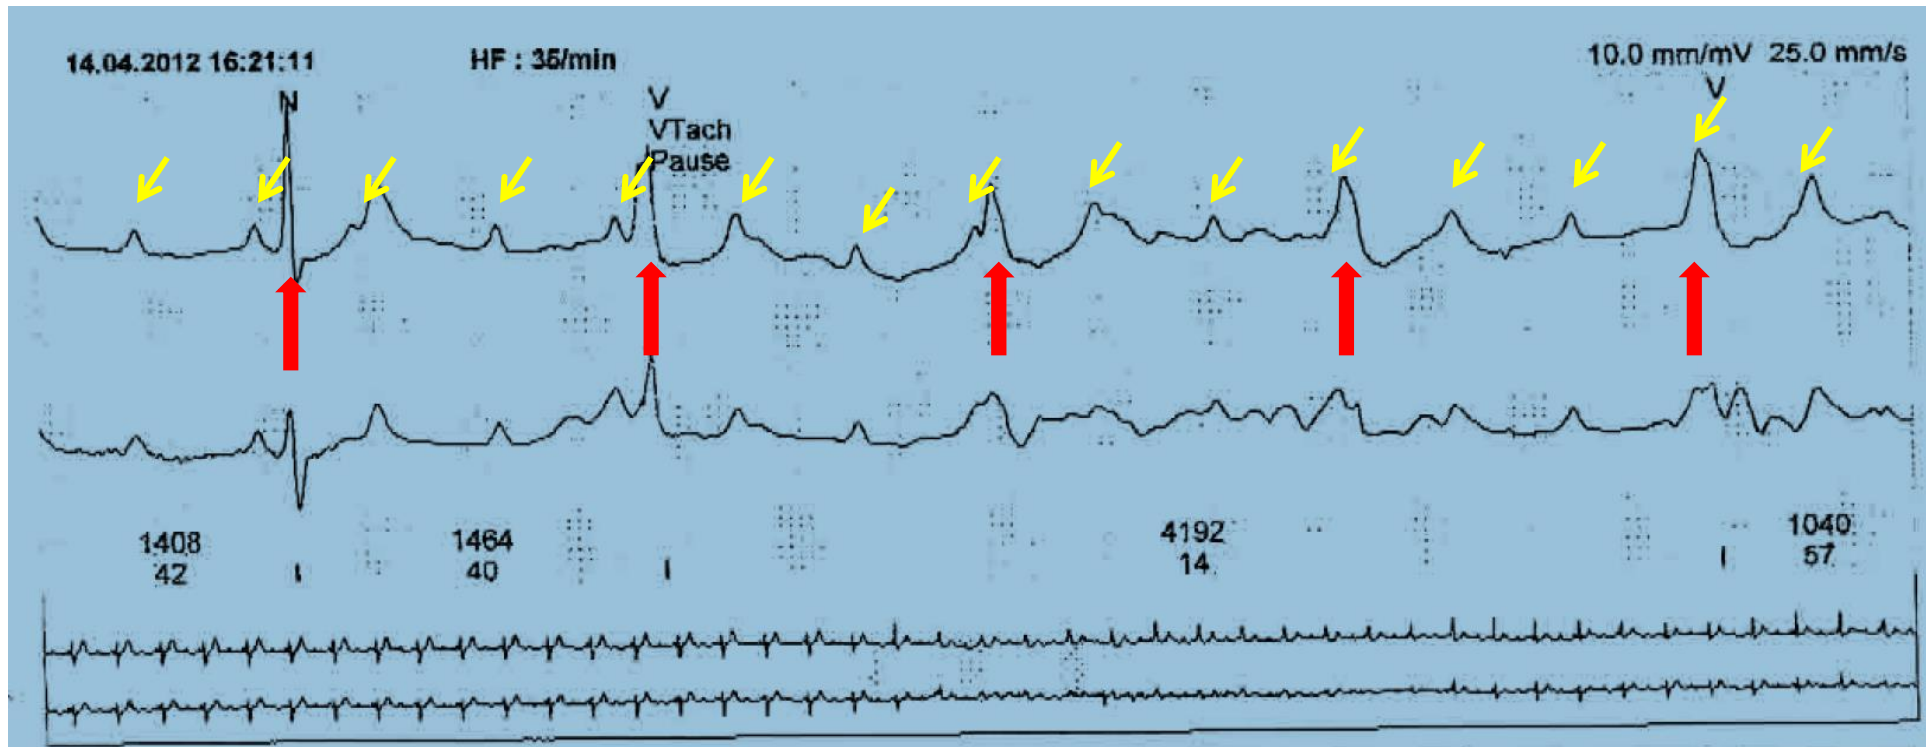

...

## Case No 1, history

- 63-years old female patient who was completely asymptomatic and healthy until 6 months ago
- During the past 6 months increasing symptoms with exercise intolerance, relatively low heart rate and ankle edema
- PAST MEDICAL HISTORY: unremarkable, no surgeries, no hospital stays, no chemotherapy, no radiation therapy
- SYSTEMIC REVIEW: no drugs, no alcohol, lifelong nonsmoker, unremarkable travel history
- FAMILY HISTORY: no known cardiac issues (parents, 2 siblings, 3 children)

GP sent her for **Holter-EKG** because of relatively low heart rate

# Case No 1, Holter EKG

High degree AV-Block (intermittently)

## Case No 1, echocardiography

- Dilated left ventricle
- Reduced LVEF (30%)
- Moderate mitral regurgitation

## Case No 1, further diagnostics

- CORONARY ANGIOGRAM: normal coronary arteries, LVEDP 17mmHg
- CARDIAC MRI: LGE images with significantly reduced quality, suspected mid wall fibrosis inferior and inferior-lateral

## Case No 1, further diagnostics

FDG-PET: bilateral lymphadenopathy

TRANSBRONCHIAL BIOPSY

Sarcoidosis with cardiac and pulmonary involvement

## Case No 1, treatment

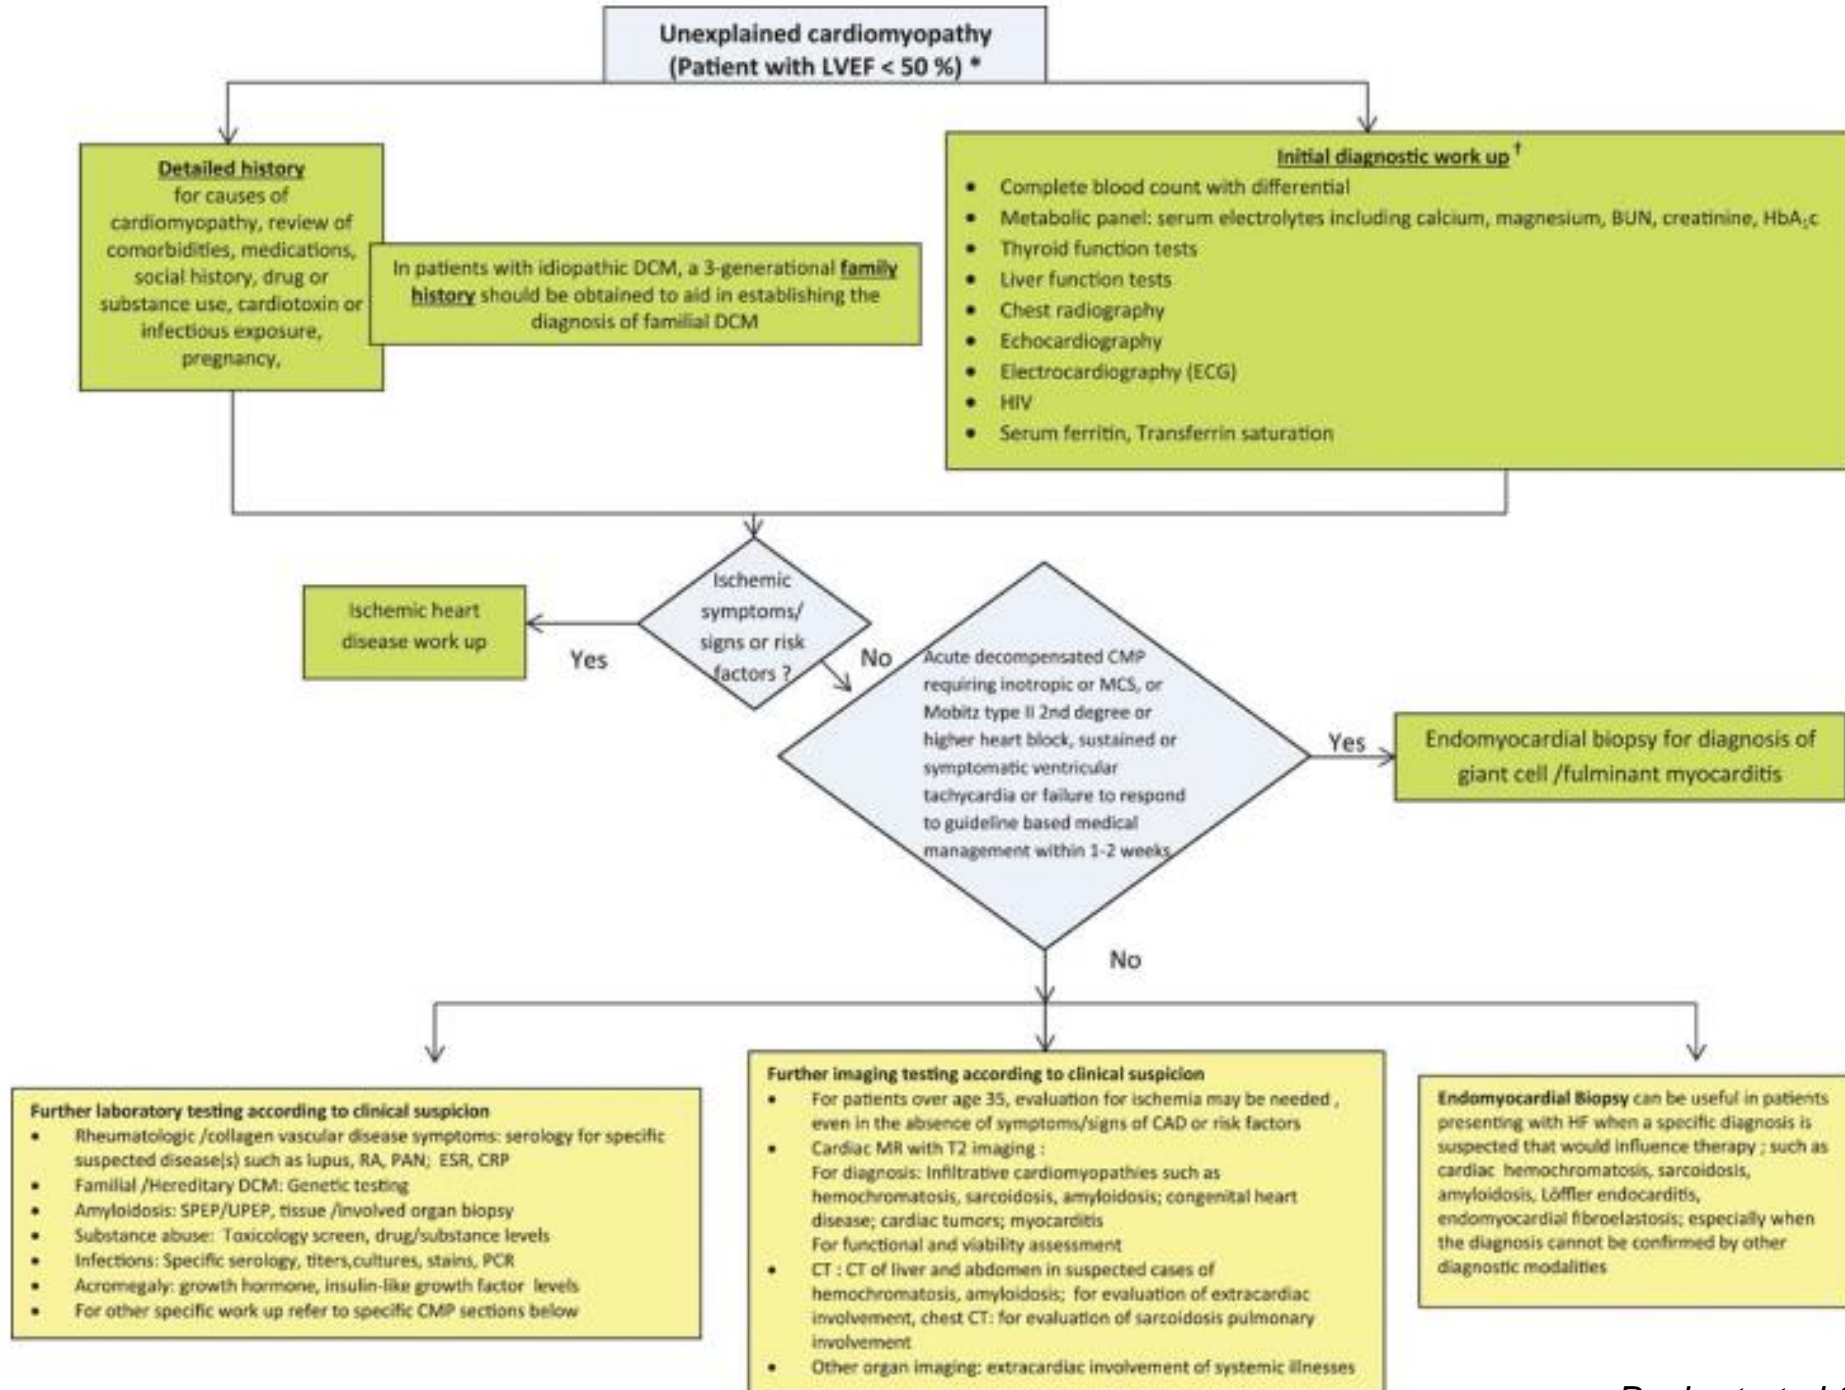

- Patient received CRT-D
- Heart failure medication (ACE-I, BB, diuretics)
- Immunosuppressive agents (steroids + MMF, later adalimumab)
- Ejection fraction improved to 45-50%, patient is asymptomatic

## Case No 1, treatment

**TAKE HOME MESSAGE # 1:**  
**CORRECT DIAGNOSIS IS KEY AND HAS**  
**IMPLICATIONS ON TREATMENT, PROGNOSIS**  
**AND THE FAMILY!!!**

# Differential diagnosis: dilative cardiomyopathy

*Coronary artery disease*

## *Infectious/inflammatory*

viral myocarditis  
giant cell myocarditis  
HIV, Hepatitis B/C  
Chagas

## *Metabolic*

Hypo-, Hyperthyreoidosis  
Diabetes mellitus  
Obesity  
Mitochondrial cytopathies  
(Barth-S,...)  
Acromegaly

## *Toxic*

Alcohol  
Chemotherapy  
Radiation  
Metamphetamines  
Methylphenidate

## *Pregnancy*

Peripartum cardiomyopathy

## *Neuromuscular*

Curschmann-Steinert  
Duchenne, Becker  
Friedreich-Ataxia

## *Infiltrative*

Sarcoidosis  
Amyloidosis  
Hämochromatosis

## *Autoimmune*

Systemic Lupus  
Rheumatoid arthritis  
Scleroderma  
Dermatomyositis  
Panarteriitis nodosa

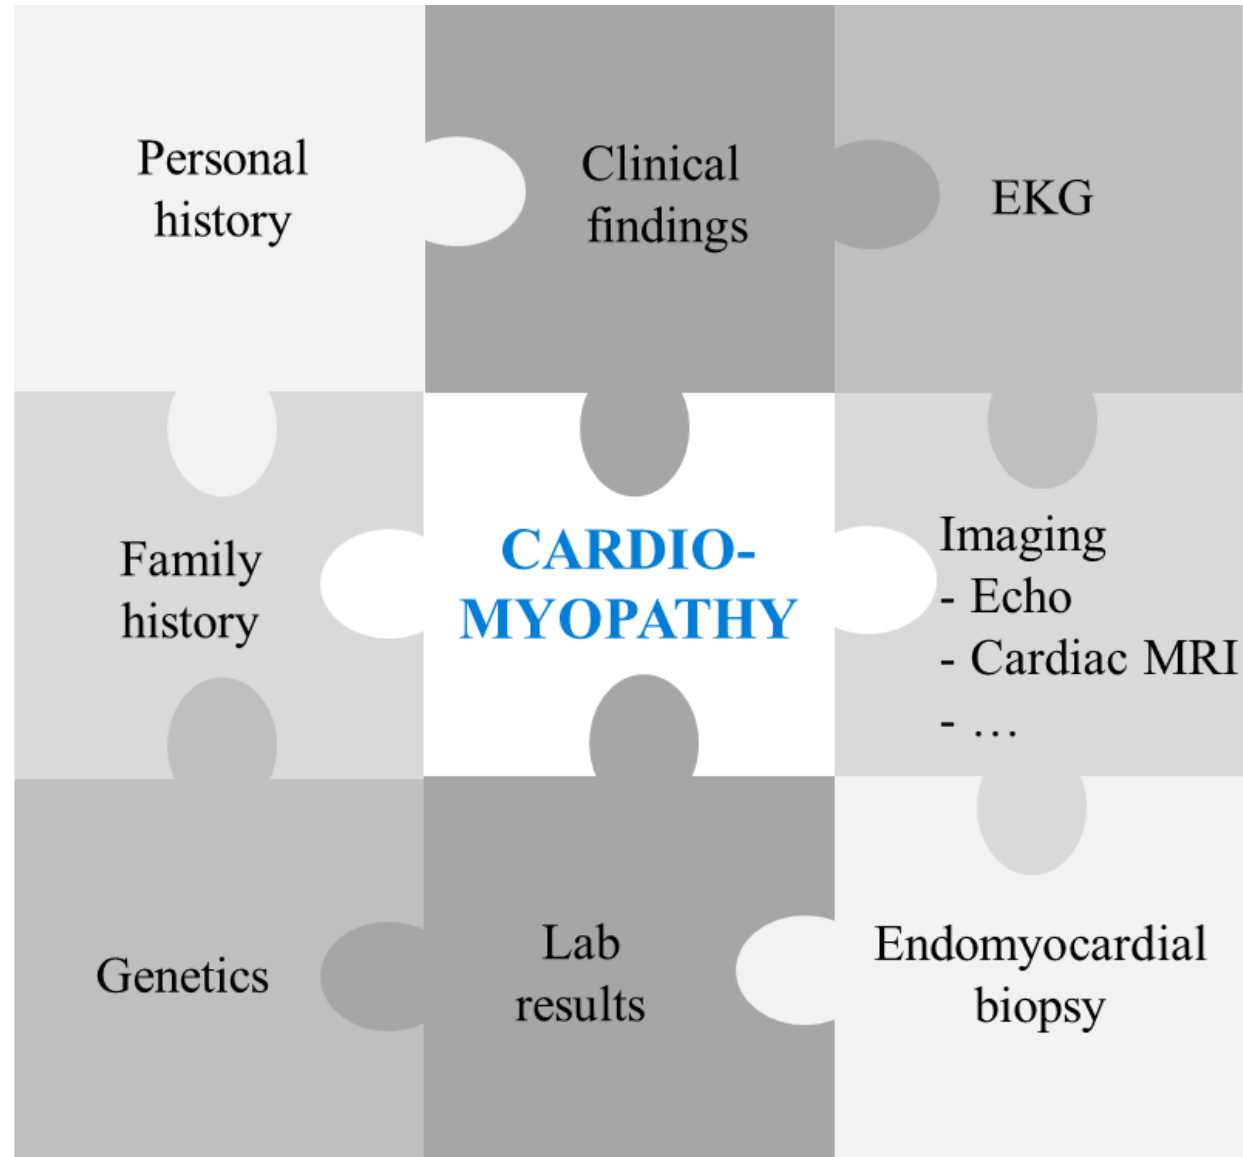

## *Noncompaction CMP*

# Genetics in dilative cardiomyopathy

- 1/3 of cases inherited / familial → family tree (3 generations) and family screening (EKG, TTE)
- Autosomal-dominant, X-linked, mitochondrial

# Cardiomyopathies, diagnostic process

## Case No 2, cardiac history

- Female patient who first felt palpitations and presyncope at the age of 35 during her second pregnancy (2010) – presented in emergency room: VPBs on monitor. In the end: **no specific measures**. Childbirth was uneventful, afterwards for several years no symptoms anymore.
- 2017 again palpitations that persisted though she quit smoking. In addition shortness of breath, leg weakness.
- October 2018 (age 43) first cardiology consult: echo normal, limited exercise capacity (70 Watts, 56% predicted), **no Holter monitor**; family history was positive for cardiac events (pacemaker, coronary artery disease, SCD). **Conclusion: lack of physical training.**

Geb:	21.08.1975	Max. Last	70W (126) W	(56.8) %
Alter:	43 Jahre	Max HF	227 (177) /min	(128) %
Geschl:	W	Max BD	186 / 140 mmHg	
Grösse:	166.0 cm	Max. BD x HF	318 mmHg / min	
Gewicht:	64.0 kg	Min. BD x HF	107 mmHg / min	
Indik:		DP-Faktor	3.0	
Med:		Körperoberfläche	1.712 m <sup>2</sup>	
		PWC 150/170	50 / 67 W	
		PWC rel	0.78 / 1.05 W/kg	
		Leistungsgewicht	1.1 W/kg	

Abbr.-Kriterien: Dyspnoe, Muskelschmerzen

Bem: Amb.

Protokoll: KSM  
Ergo / BD: Ergoline 900/911 digital / BP-200 plus

Rapid and extreme increase of heart rate (170bpm at 70 Watts)

Dauer vor Belast. 0:47 Testdauer 7:16 Erholung

### Interpretation

Knapp aussagekräftige Untersuchung bei submax. Leistungsfähigkeit. Klinisch und elektrokardiographisch keine Hinweise auf eine Myokardischämie. Rascher und ausgeprägter Pulsanstieg unter Belastung, normales Blutdruckverhalten.

## Case No 2, cardiac history

- June 2020, since 4 weeks significant palpitations, again cardiologic work-up. Echo normal, Holter monitor with frequent VPBs (36%) and nsVTs.

1ax. HF, während Laufen: polymorphe VES, SR 7.5s

HF137 BPM 25mm/s 10mm/mV 0-60Hz 29.05.2020 13:46::

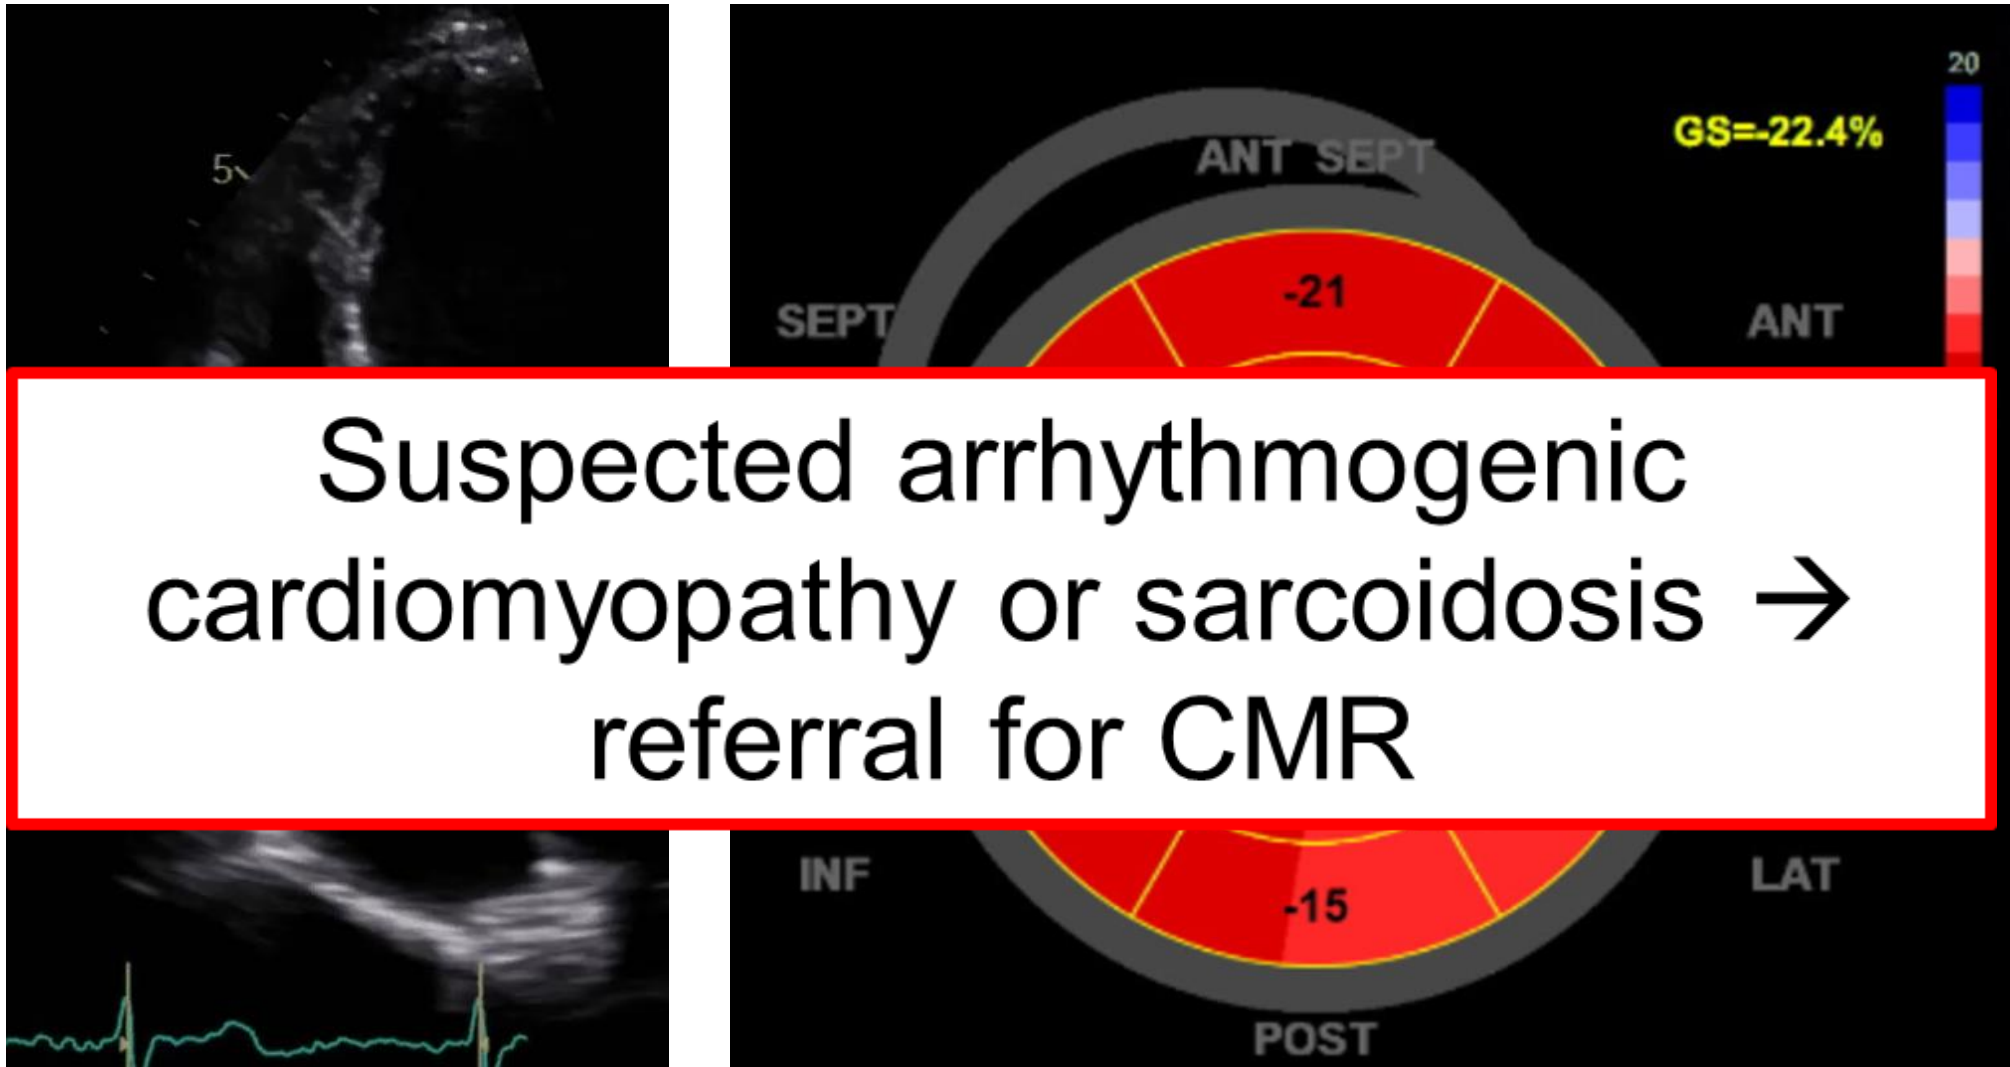

# Case No 2, echocardiography

## Case No 2, echocardiography

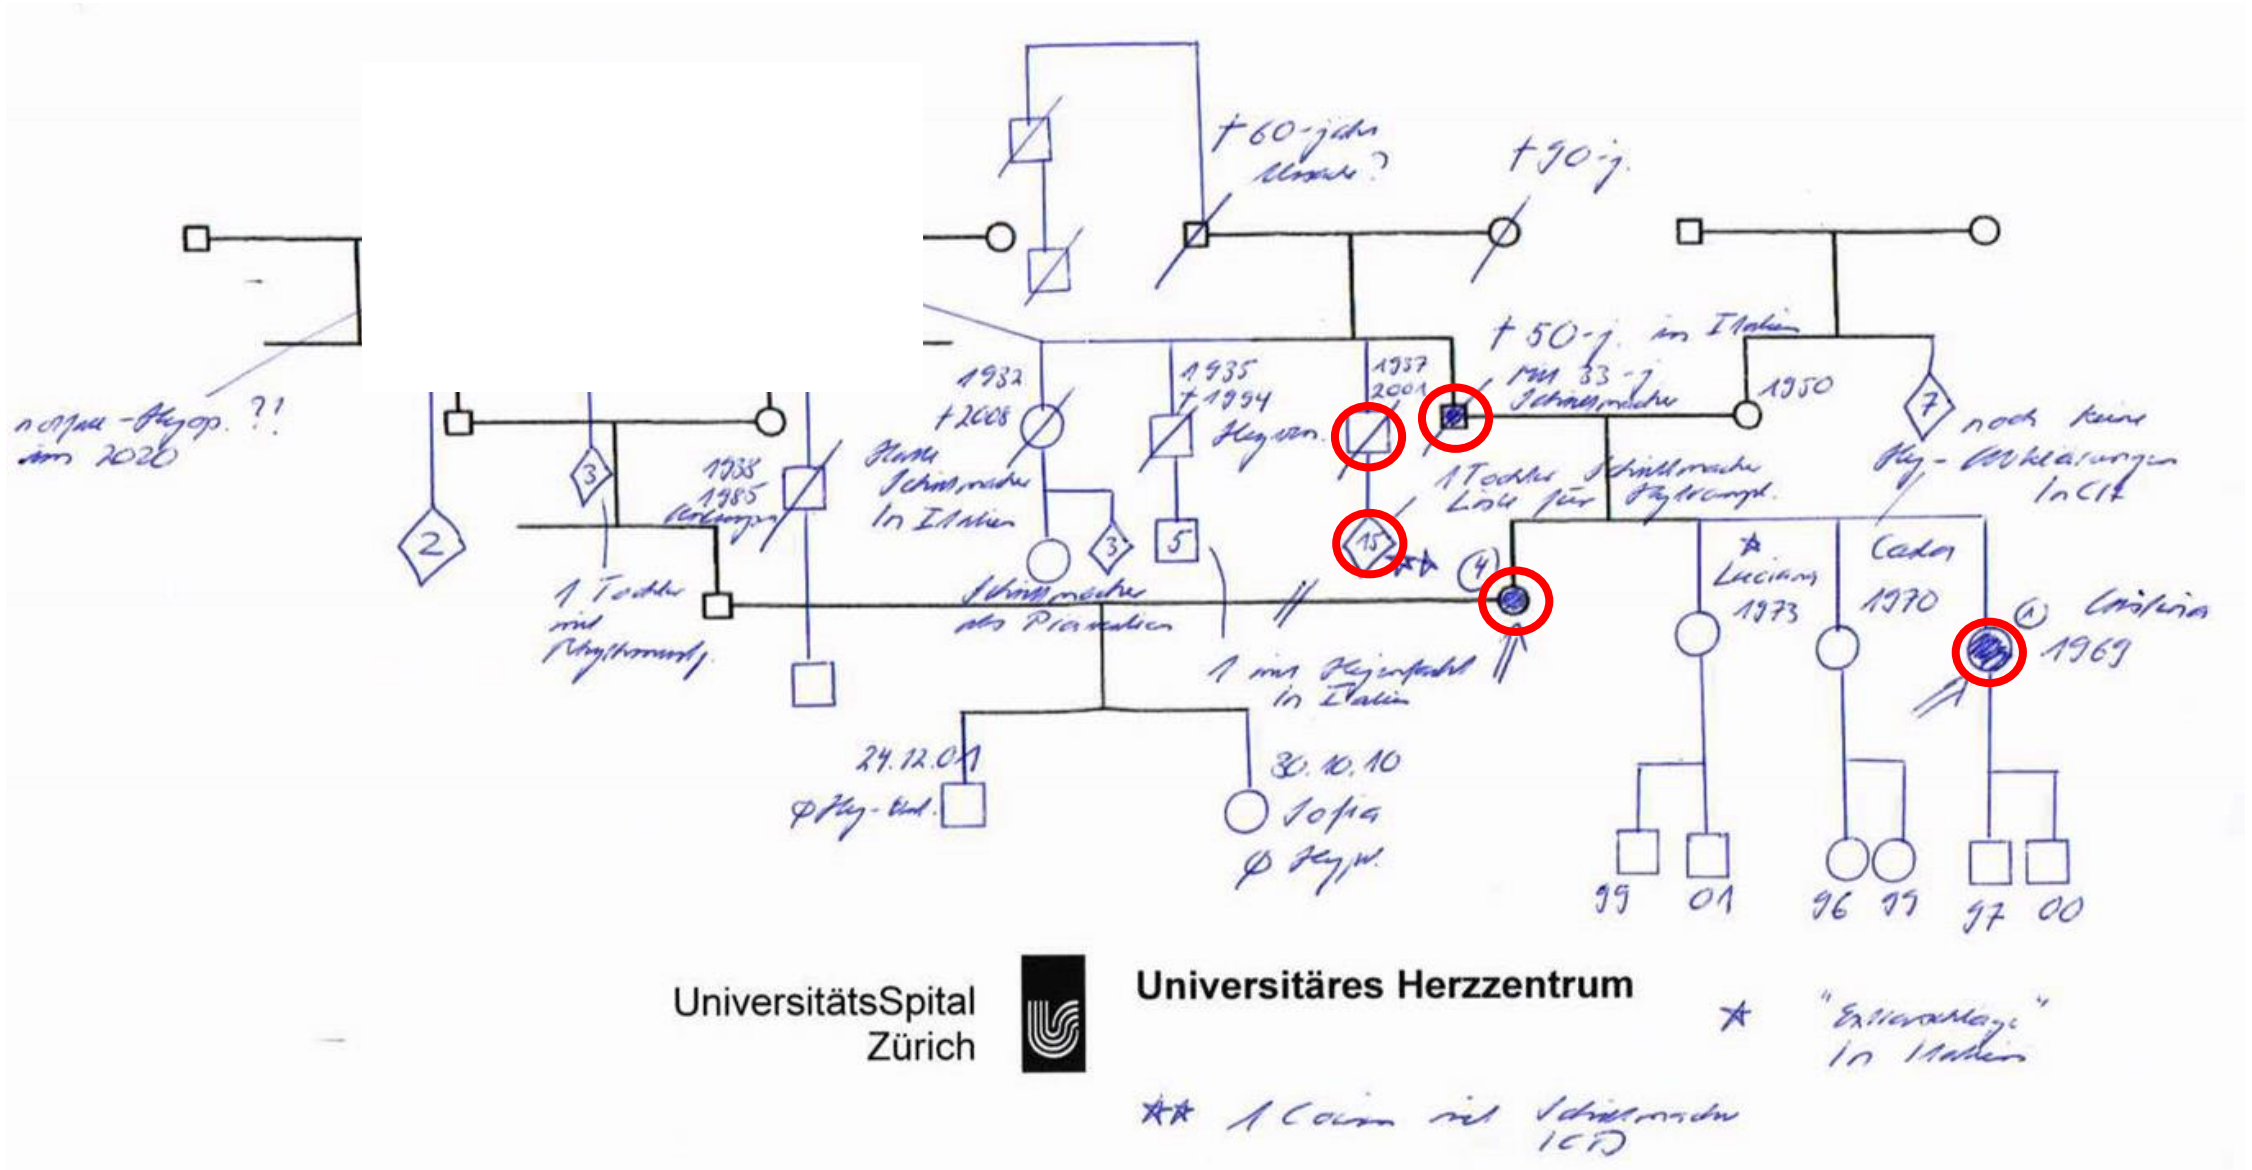

## Case No 2, CMR

Conclusion: inflammatory / infiltrative process

- r/o inflammation with FDG-PET scan
- r/o coronary artery disease with CT scan

# Case No 2, family history

# Case No 2, genetic testing

## RAPPORT D'ANALYSES MOLECULAIRES

Genève, le 21/04/2021

- Indications :** Suspicion de cardiomyopathie arythmogène
- Demande :** Séquençage de l'exome. Recherche de variants dans 151 gènes impliqués dans les cardiomyopathies (Panel: PanelApp/Cardiomyopathies\_-\_including\_childhood\_onset\_v1.12,PanelApp/Cardiac\_arrhythmias\_v6.55, gènes verts).
- Matériel analysé :** ADN DM-20.1857\_ADN-001
- Résultat :**

**splice site mutation**

**MISE EN EVIDENCE D'UN VARIANT D'ÉPISSAGE DANS LE GÈNE **LMNA****

- site donneur d'épissage, c.356+2T>C, hétérozygote, p.?  
Séq de réf: NM\_170707 , chr1:156'085'067 (GRCh37/hg19)

Statut de porteur chez des apparentés:  
- Soeur: [REDACTED] (née le 01.01.1969, DM-20.1858) **porte** le variant c.356+2T>C

- Interprétation :** Le variant identifié dans le gène **LMNA** explique très probablement le tableau clinique de la patiente (variant pathogène, classe 5).

**Cardiolaminopathy / LMNA-dependent cardiomyopathy:**  
Form of dilated cardiomyopathy typically associated with conduction disorders and arrhythmias → **ARRHYTHMOGENIC CARDIOMYOPATHY**

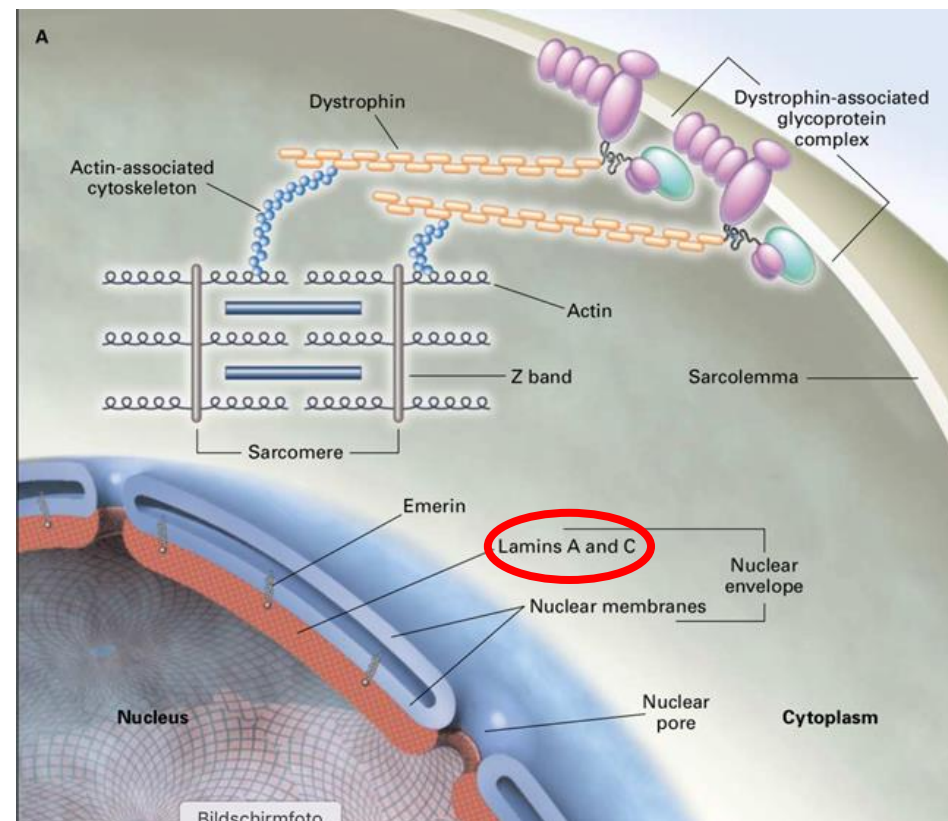

# LMNA mutations – DCM described in 1999 in NEJM

## MISSENSE MUTATIONS IN THE ROD DOMAIN OF THE LAMIN A/C GENE AS CAUSES OF DILATED CARDIOMYOPATHY AND CONDUCTION-SYSTEM DISEASE

DIANE FATKIN, M.D., CALUM MACRAE, M.D., TAKESHI SASAKI, M.D., MATTHEW R. WOLFF, M.D., MAURIZIO PORCU, M.D.,

# Characteristics of cardiomyopathies

- LMNA is the second most commonly mutated gene associated with familial DCM (5%), number raising up to 33% for cases presenting with both – DCM and conduction defects
- Bradyarrhythmias, supraventricular arrhythmias often precede by decades the development of DCM (*Kumar et al 2018*)
- Variable extent of ventricular dilatation, less frequently left ventricular non-compaction (*Sedaghat-Hamedani et al. 2017*)
- Very **wide** inter- and intrafamilial **clinical variability**
- Development of phenotype between 20 and 39 years of age in 2/3 of cases; **complete penetrance** by the age of 60
- Among DCM patients, carriers of LMNA variants experience the **highest rates of SCD/VT/VF** independent of LVEF (*Gigli et al. 2019*)
- Male sex, non-missense mutations and nsVTs are predictors of malignant ventricular arrhythmias

# Characteristics of cardiomyopathies

## Case No 2: follow-up

FU PATIENT:

- Bisoprolol 5mg od, insertion of 2 chamber defibrillator
- Neurologic work-up did not show any skeletal muscle involvement
- in the process of clinical and genetic family screening

**TAKE HOME MESSAGE # 2**

**SOMETIMES THE EKG IS MORE EXCITING  
THAN THE ECHO**

**TAKE HOME MESSAGE # 3**

**NOT EVERY UNEXPLAINED SCAR ON CMR IS  
'POST-MYOCARDITIS'**

# Definition of hypertrophic cardiomyopathy

- Asymmetric left ventricular hypertrophy with maximal wall thickness of  $MWTH \geq 15\text{mm}$  in the absence of LV dilatation and lack of other cardiac or systemic reasons causing left ventricular hypertrophy
- Most frequent hereditary cardiomyopathy (prevalence 1:500)

# Differential diagnosis of hypertrophic cardiomyopathy

*Hypertensive heart disease*

*Athlete's heart*

## *Metabolic*

Fabry disease

glycogen storage diseases

PRKAG2 cardiomyopathy

Danon disease

Mucopolysaccharidosis

Oxalosis

Mitochondrial cytopathies

Hypothyreoidism

Obesity

## *Syndromic diseases*

Friedreich ataxia

Noonan syndrome

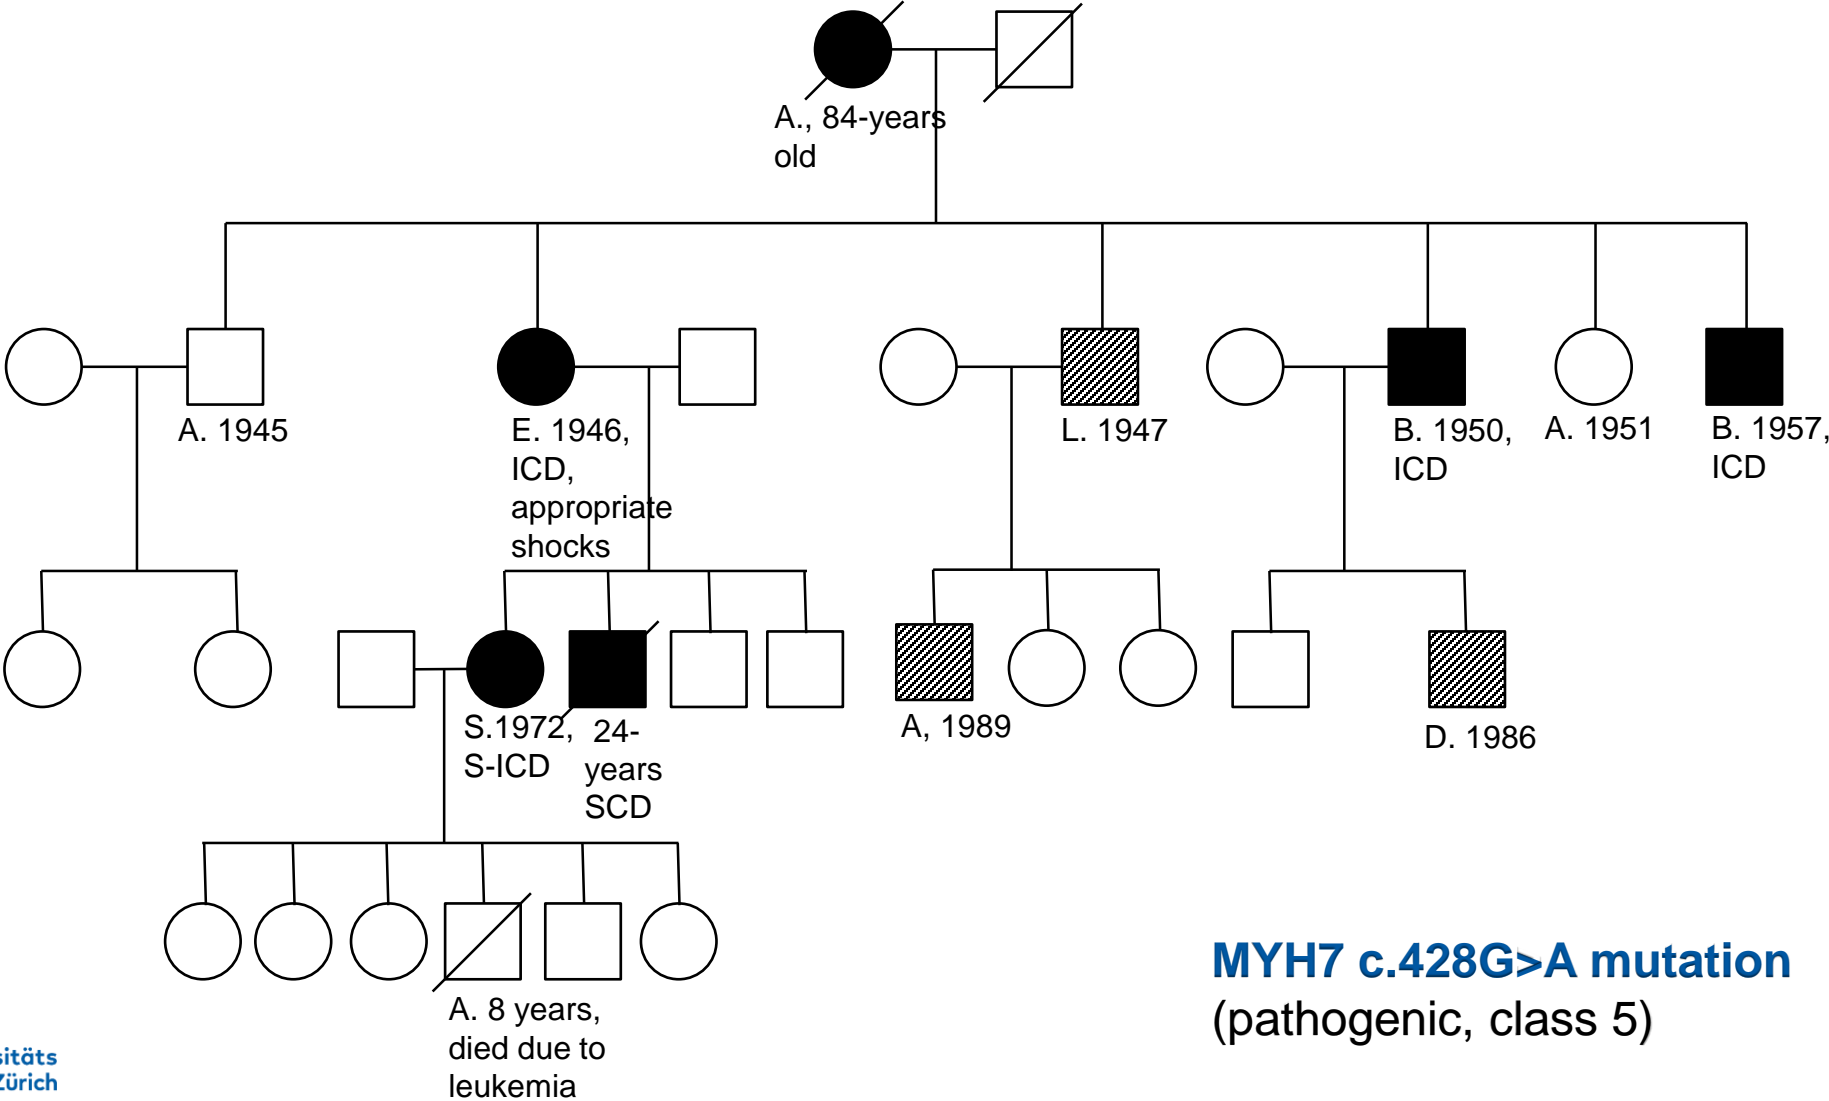

## *Infiltrative*

Amyloidosis

Haemochromatosis

Sarcoidosis

# Case No 3, hypertrophic cardiomyopathy and phenotypic expression

**MYH7 c.428G>A mutation**  
(pathogenic, class 5)

# Case No 3, family members with positive geno- and phenotype

E., 1946

S., 1972

B., 1950

# Case No 3, family members with positive genotype, negative phenotype

L., 1947

A., 1989

D., 1986

## Case No 3, family members with positive genotype, negative phenotype

TAKE HOME MESSAGE # 4

NO GENOTYPE PHENOTYPE CORRELATION

TAKE HOME MESSAGE # 5

FAMILY SCREENING MUST BE REPEATED

# Genetics in hypertrophic cardiomyopathy

- autosomal dominant
- Prevalence 1:500 with HCM in general population

- 1  $\beta$ -Myosin heavy chain
- 2 Myosin-binding protein-C
- 3 Myosin light chain 2 and 3
- 4 Troponin T
- 5 Troponin I
- 6 Tropomyosin
- 7 Actin

## Phenocopies

- Fabry's disease
- PRKAG2 cardiomyopathy
- Danon's disease
- TTR amyloidosis

**CURRENT PANELS INCLUDE  
>100 CMP GENES**

# Genetics in hypertrophic cardiomyopathy

# Genetics in hypertrophic cardiomyopathy, penetrance

## CENTRAL ILLUSTRATION Kaplan-Meier Estimates of Penetrance of Hypertrophic Cardiomyopathy in the Study Cohort by Sex

285 adult and pediatric carriers of pathogenic/likely pathogenic sarcomere protein variants with no hypertrophic cardiomyopathy (HCM)

Penetrance of HCM at 15-year follow-up: 46% (95% CI: 38%-54%)

Number at risk

	0	5	10	15	20
Male	141	91	45	16	5
Female	144	106	64	22	5

Lorenzini, M. et al. J Am Coll Cardiol. 2020;76(5):550-9.

### Risk factors for HCM

Male  
HR: 2.91  
(95% CI: 1.82-4.65)

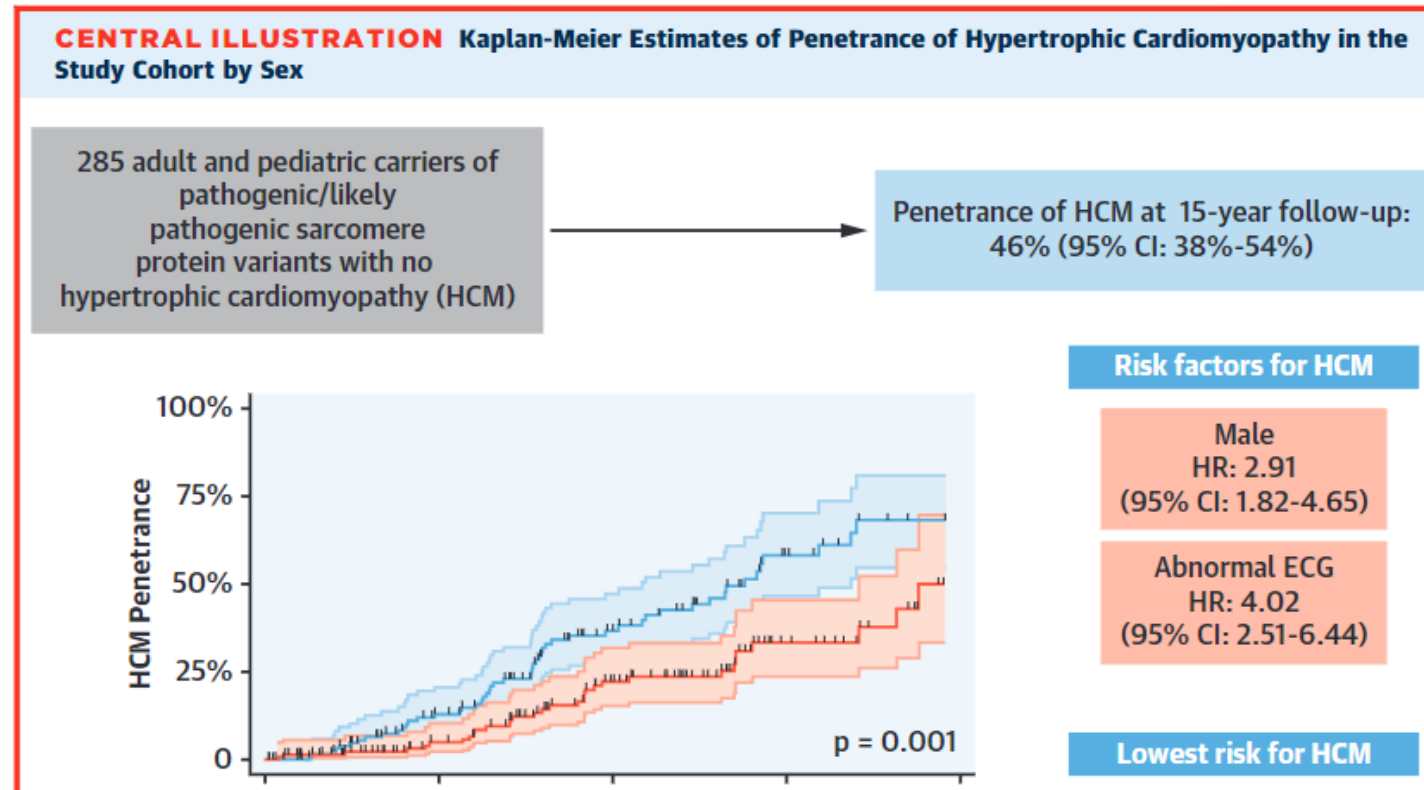

Abnormal ECG  
HR: 4.02  
(95% CI: 2.51-6.44)

### Lowest risk for HCM

*TNNI3* variants  
HR: 0.19  
(95% CI: 0.07-0.55)

Male sex and abnormal electrocardiogram are risk factors for penetrance of hypertrophic cardiomyopathy (HCM) in carriers of pathogenic/likely pathogenic variants in sarcomere genes, while *TNNI3* variants are protective.

# Genetics in hypertrophic cardiomyopathy, penetrance

TAKE HOME MESSAGE # 6

NO GENETICS WITHOUT CARDIAC GENETICIST

# Thank you
